Description			

Description

Consider changing RealRoots so that it computes the sqfr decomp of the input poly, then works on the separate pieces. Joining the answers together may require some thought/computation.

#### History

#### #1 - 30 Sep 2019 16:11 - John Abbott

I have already begun writing a package called RRList. I think this is related, esp. as regards combining the intervals for different polys.

RRList should use CoprimeFactorBasis (if it does not already).

### #2 - 30 Sep 2019 16:14 - John Abbott

Sqfr decomp should always be reasonably quick; full factorization could be slow if the input is "nasty".

One could consider looking for self-reciprocal factors... not sure it is worth it.
