Description Should there be a function called CommonDenom (or something similar)? For polynomials? For lists of polynomials?

In fact there is already an undocumented builtin fn called CommonDenom, but only for RINGELEM. The fn also exists in CoCoALib (and is documented there).

What are the exact semantics? And what should they be?

Should the fn be extended to lists of RINGELEM? (also in CoCoALib?)

- Related to Support #977: "universal denominator" (related with GroebnerFanIdeals) added

#3 - 21 Nov 2016 14:41 - John Abbott

Some aspects to consider when deciding the semantics:

- we may assume that the result is positive (if coeffs in QQ)
- defn is clear in $QQ[x,y,z]$
- should it also work for $QQ[a,b][x,y,z]$?
- should it also work for $QQ(a,b)[x,y,z]$ or $FrF(ZZ[a,b])[x,y,z]$
- should it work for an element of QQ or even of ZZ?

If we make it work for lists of RINGELEM, should it be recursive (e.g. so it would work for list of list of RINGELEM)?

- Target version changed from CoCoA-5.2.0 spring 2017 to CoCoA-5.2.2

- We are going to work on this, better postpone this.

#5 - 15 Nov 2017 17:36 - Anna Maria Bigatti

- *Target version changed from CoCoA-5.2.2 to CoCoA-5.2.4*

Work on "ideals mod p" still in progress.
Postpone to next version.
